

Add a Key

● Solved

Helpful

For this problem, the prefilled code will contain a dictionary. Write a program to add a key-value pair to the dictionary.

Input

The input will be a single line containing the strings, separated by space, denoting the key-value pair.

Output

The output should be a single line containing the dictionary with the added key-value pair.

Explanation

For example, if the given string is "Ramesh Cricket", your code should add the key "Ramesh" and the value for it should be "Cricket". So the output should be

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Ramesh': 'Cricket'}
```

Sample Input 1

```
Ramesh Cricket
```

Sample Output 1

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Ramesh':
```

Sample Input 2

```
Suresh Chess
```

Sample Output 2

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Suresh':
```

Update Value of Key

● Solved

Helpful

For this problem, the prefilled code will contain a dictionary. Write a program to update the value of a given key.

Input

The input will be a single line containing the strings, separated by space, denoting the key-value pair.

Output

The output should be a single line containing the dictionary with the updated value to the given key.

Explanation

For example, if the given string is "Rahim Hockey", your code should update the key "Rahim" with the value "Hockey". So the output should be

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Hockey', 'Deepak': 'Boxing'}
```

Sample Input 1

```
Rahim Hockey
```

Sample Output 1

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Hockey', 'Deepak': 'I
```

Sample Input 2

```
Vani Badminton
```

Sample Output 2

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Badminton', 'Rahim': 'Cricket', 'Deepak
```

Remove a Key

● Solved

Helpful

For this problem, the prefilled code will contain a dictionary. Write a program to remove a key.

Input

The input will be a single line containing a string, denoting the key to be removed.

Output

The output should be a single line containing the dictionary without the given key and its value.

Explanation

For example, if the given string is "Vani", your code should print the dictionary without the key-value pair of "Vani" So the output should be

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Rahim': 'Cricket', 'Deepak': 'Boxing'}
```

Sample Input 1

```
Vani
```

Sample Output 1

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Rahim': 'Cricket', 'Deepak': 'Boxing'}
```

Sample Input 2

```
Rahim
```

Sample Output 2

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Deepak': 'Boxing'}
```

Sports Data

● Solved

Helpful

A college is conducting its annual sports meet. So they need data of students with the sport they play. Each student can participate in only one sport.

For this problem, the prefilled code will contain a dictionary. Write a program to add a list of tuples to the dictionary as key-value pairs. If a student's name appears more than once, update the latest sport entry.

Input

The first line of input will contain an integer N, denoting the number of key-value pairs.

The next N lines will contain space-separated strings, denoting key followed by the value.

Output

The output should be a single line containing the dictionary with the added key-value pairs.

Explanation

For example, if the given N is 3, read the inputs in the next three lines, if the given three inputs are the following.

```
Gopal Hockey
Jyothi Cricket
Akhil Football
```

Your code should print the dictionary with all the key-value pairs. So the output should be

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Gopal': 'Hockey', 'Jyothi': 'Cricket', 'Akhi
```

Sample Input 1

```
3
Gopal Hockey
Jyothi Cricket
Akhil Football
```

Sample Output 1

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Gopal': 'Hockey', 'Jyothi': 'Cricket', 'Akhi
```

Sample Input 2

```
4
Suresh Chess
Latha Chess
Mohan Tennis
Ashok Football
```

Sample Output 2

```
{'Ram': 'Cricket', 'Naresh': 'Football', 'Vani': 'Tennis', 'Rahim': 'Cricket', 'Suresh': 'Chess', 'Latha': 'Chess', 'Mohan': 'Tennis', 'Ashok': 'Football'}
```

Squares

● Solved

Helpful

Write a program to create a dictionary that contains keys as numbers from 1 to N and values are square of keys.

Input

The input will be a single line containing an integer (N).

Output

The output should be a single line containing the dictionary with key-value pairs from 1 to N.

Explanation

For example, if the given N is 3, your code should print a dictionary with keys (1, 2, 3) and values (1, 4, 9). So the output should be

```
{1: 1, 2: 4, 3: 9}
```

Sample Input 1

```
3
```

Sample Output 1

```
{1: 1, 2: 4, 3: 9}
```

Sample Input 2

```
4
```

Sample Output 2

```
{1: 1, 2: 4, 3: 9, 4: 16}
```

Remove N Keys

● Solved

Helpful

For this problem, the prefilled code will contain a dictionary. Write a program to remove N key-value pairs from the dictionary if they present.

Input

The input will be a single line containing space-separated strings, denoting the keys.

Output

The output should be a single line containing the dictionary without the given key-value pairs.

Explanation

For example, if the given string is "a d g", your code should print the dictionary without key-value pairs of (a, d, g). So the output should be

```
{'b': 98, 'c': 99, 'e': 101, 'f': 102, 'h': 104}
```

Sample Input 1

```
a d g
```

Sample Output 1

```
{'b': 98, 'c': 99, 'e': 101, 'f': 102, 'h': 104}
```

Sample Input 2

```
a b f k
```

Sample Output 2

```
{'c': 99, 'd': 100, 'e': 101, 'g': 103, 'h': 104}
```
